Understanding Yale University VPN

The Yale University VPN is a virtual private network service specifically designed to provide secure remote access to Yale's campus network. It encrypts the internet connection of users, protecting sensitive information from interception and unauthorized access. This VPN service allows Yale affiliates to access restricted academic resources, databases, and internal systems as if they were physically on campus. By utilizing the Yale University VPN, users can maintain confidentiality and integrity of their data while connected to public or unsecured networks.

What is a VPN?

A Virtual Private Network (VPN) creates a secure, encrypted tunnel between a user's device and a remote server. This technology masks the user's IP

address, enhances privacy, and prevents eavesdropping, especially when using public Wi-Fi networks. In the context of Yale University, the VPN connects users to Yale's private network, enabling access to services that require campus authentication.

Why Yale University VPN is Necessary

Yale University VPN is necessary for several reasons, including:

- Accessing subscription-based academic journals and databases restricted to Yale affiliates.
